98.6° — Complete Product Specification & Brand Guide (Launch)

1. Executive Summary

98.6° is a one-time-purchase metabolic health app that combines daily temperature and pulse tracking, a curated compound research library, and doctor-ready reports in a calm, Monterey Bay–inspired interface. It is built for the bioenergetic / pro-metabolic community, drawing on the work of Dr. Ray Peat and Broda Barnes while staying strictly educational and non-diagnostic.

- One-time price: $59.99
- Access: Lifetime web/PWA access, no subscriptions, no ads
- Core promise: *"A beautiful, research-backed companion for your metabolism, not a doctor's prescription."*

---

2. The Offer — Summarized (Launch Scope)

When someone buys 98.6°, they get lifetime access to:

- A multi-point daily tracker for temperature and pulse across 5 time slots, with tags for food, sleep, stress, symptoms, and supplements.
- A Quick Add flow that lets them log a reading from the Home screen in under 5 seconds.
- A Research Library of 21 compounds built on 120+ peer-reviewed studies, explained in plain language with clear cautions.
- An All Entries logbook where every reading can be reviewed and edited.
- An Export Suite that generates:
    - 30/60/90-day standard trend reports
    - A doctor-ready "Metabolic Vitals Summary" PDF
    - A supplement log
    - A raw CSV file of all data for personal analysis

Planned but not in the launch build (roadmap features): AI "Ask 98.6" assistant, full pattern-detection engine, onboarding quiz, symptom-to-research connector, thyroid-trial mode, gamification badges. Keep them in the doc as clearly labeled roadmap items.

---

3. Information Architecture

Bottom navigation tabs

- Home – Daily snapshot, 7-day trend, and insights.
- Vitals – Charts and educational guidance for reading temp and pulse.
- Log – Full logging form, quick-add entry, and the All Entries logbook.
- Library – Research Library and compound detail pages.
- Profile – Settings, data management, and Export Suite.

---

4. Core Features (Launch)

4.1 Multi-Point Daily Tracker

Time slots (5):

- Waking — before getting out of bed.
- Mid-Morning — late morning.
- Post-Breakfast — ~30 minutes after first meal.
- Afternoon — mid-afternoon.
- Evening — before bed.

Per-entry fields

- Temperature (°F) with quick-select buttons + custom numeric input.
- Pulse (bpm) with quick-select buttons + custom numeric input.
- Time slot selection.
- Tags:
    - Food (e.g., Fruit + Dairy, Starch, Coffee, Skipped Meal, PUFA exposure).
    - Sleep (Rested, Poor sleep, etc.).
    - Stress level.
    - Energy / mood (Calm, Wired, Exhausted, Brain fog).
    - Symptoms (Cold hands/feet, Headache, etc.).
    - Supplements (via tags + notes).
- Notes: free-text field.

Data is stored locally (e.g., localStorage) and drives all charts and exports.

4.2 Quick Add Widget

- Seafoam floating action button on the Home screen (bottom-right).
- Slide-up modal with:
    - Auto-detected time slot based on current time.
    - Temperature and pulse inputs with sensible defaults (e.g., 98.6 °F, 72 bpm).
    - Optional “Add tags” expansion with 12 curated quick tags.
- “Save” → writes entry, shows toast (“Entry saved”), closes modal.
- Goal: <5 seconds per reading.

4.3 Vitals: Charts & Guidance

- Charts for temperature and pulse over 7/30/60/90-day windows.
- Filters by time slot (waking, post-breakfast, etc.).
- Background bands showing Barnes ranges and approximate “optimal” zone around 98.6 °F.
- Tooltips on tap/hover.

Tools for Accurate Tracking (educational card):

- Temperature guidance:
    - Use a simple digital thermometer (oral or underarm).
    - Take waking temps before getting out of bed, eating, or drinking.
    - Oral: under tongue, mouth closed until beep.
    - Underarm (axillary): high in armpit, arm against side; axillary runs ~0.5–1.0 °F lower than oral; consistency matters more than exact site.
    - Mid-day oral readings near 98.6–99.0 °F + warm hands and feet are framed as a common “healthy” pattern (non-diagnostic).
- Pulse guidance:
    - Use two fingers on wrist (radial) or side of neck; count beats for 60s or 30s×2.
    - Suggest checking pulse at the same times as temp (waking, after meals).
    - Emphasize that temp + pulse together say more than either alone; mention that many Peat-style practitioners look for a warm temp plus resting daytime pulse in the high-70s–mid-80s bpm when metabolism is well-supported (without prescribing it as a target).

4.4 Log Tab: Full Logging + All Entries

Logging form

- Full version of the Quick Add fields (time slot, temp, pulse, tags, notes).

- “Save” button creates entry.

All Entries logbook

- “View all entries” link under the Save button.
- Opens full-screen list:
    - Reverse chronological, grouped by date.
    - Each row: time, time slot label, temperature, pulse, up to three tags, chevron.
    - Empty state with soft icon and helper text if no entries exist.

Edit Entry

- Tapping a row opens Edit screen:
    - Same UI as logging form.
    - All fields pre-filled.
    - Buttons:
        - “Save changes” — updates entry in place; charts and stats refresh.
        - “Delete entry” — coral-outlined; inline confirmation bar before delete.

---

5. Research Library (UI & Content)

5.1 Library Header

- Title: Research Library (serif, centered).
- Quote from Ray Peat, with “— Dr. Ray Peat” centered just below in smaller, lighter type.
- Short intro:
    - “A hand-picked library of research-backed compounds.”
    - “Built on 120+ peer-reviewed studies you can read yourself.”
- Link: “What is this library?” (teal).
    - Opens modal explaining:
        - The library is built on 120+ peer-reviewed studies.
        - Each compound page explains what it is, how it works, and key research findings.
        - Strong disclaimer: educational only; not medical advice.
- Background: watercolor scenery faded with a soft white overlay for readability.

5.2 Compound List & Icons

- Scrollable list of 21 compounds.
- Each item shows:
    - Watercolor icon (round, ~40px) tinted by category color using a shared grayscale texture.
    - Name.
    - One-line summary (type + a couple of key symptom associations).
    - Chevron to expand.

---

6. Compound Profiles & Schema (Launch)

Every compound uses the enhanced schema (simplified here for launch):

1. Core Identification
    - `id`, `name`, `category`, `icon` (watercolor icon), `tagline`.
2. Master Article
    - What it is (2–3 sentences).
    - Role in metabolism (3–5 sentences).
    - Mechanism (3–5 sentences).
    - Peat context where applicable (2–3 sentences).
    - Fuel context: how it relates to glucose oxidation vs stress-driven metabolism.
3. Practical Guide (informational)
    - "Dosages studied" in research (ranges, not prescriptions).
    - Food sources (Peat-friendly where possible).
    - Timing notes, if relevant.
    - Interactions.
4. Important Cautions (for all compounds; more detailed for high-risk ones)
    - WHO SHOULD BE CAREFUL.
    - UPPER LIMITS STUDIED.
    - INTERACTIONS.
    - SPECIAL POPULATIONS.
    - Amber box styling; explicit "informational only, not medical advice" note.
5. Studies
    - 3–5+ key studies with title, year, journal, model/population, design, key finding, DOI.
    - Where available: type (RCT, review, mechanistic, etc.), population, and a simple evidence-weight flag.
6. Connections
    - Symptom links (mapped to tag names).

    - Related compounds.

The 21 compounds span amino acids, vitamins, minerals, hormones/precursors, other compounds, anti-nutrients (PUFA entry is purely educational), and gut support.

---

7. Export Suite (Launch)

Accessible via Profile → Export Reports.

7.1 Standard Report (30/60/90-day)

- Time-window options with unlock thresholds:
    - 30-day: ≥7 days of data.
    - 60-day: ≥14 days.
    - 90-day: ≥30 days.
- Includes:
    - Average temp & pulse; minimums/maximums with dates.
    - Averages by time slot across window.
    - Highest- and lowest-temp days.
    - Simple correlation blurbs between tags and vitals.
    - Charts for temp and pulse trends.
- Generated as letter-sized PDF with logo, date, and disclaimer.

7.2 Doctor Visit Report

- Header: “Metabolic Vitals Summary — Prepared for Healthcare Provider”.
- Normal clinical reference ranges beside user values.
- Clear labeling for self-reported data and non-diagnostic use.

7.3 Supplement Log

- Table of dates with:
    - Logged supplements/notes.
    - Average temp and pulse that day.

7.4 CSV Export

- Raw file with:
    - Date, time, time slot, temp, pulse, food tags, sleep tags, stress, symptoms, supplements/notes, all tags.

---

8. Data, Storage, and Privacy

- All data stored locally in v1 (no cloud sync or accounts).
- User controls:
    - Clear data, generate exports, manage tracking settings.
- No ads, trackers, or third-party data sales.

---

9. Visual & Brand System (Launch)

- Palette: cream background; seafoam/teal accents; coral for alerts; deep navy text; soft greens/browns in watercolor scenes.
- Typography: serif headings + sans-serif body; larger than typical mobile body size.
- Watercolor icons: single grayscale texture recolored into teal/coral/blue/beige category icons.
- Tone: calm, confident, book-ish; no hype; honest about what's known and what isn't.

10. Roadmap (Not in Launch Build)

Keep these sections in the PDF but clearly labeled as "Planned (v1.1+)":

- Pattern detection & interpretation engine (auto insight cards tied to Peat patterns).
- "Where do I start?" onboarding quiz.
- Symptom-to-Research connector ("Insights for you" screen).
- "Ask 98.6" AI assistant.
- 14-day thyroid trial mode.
- Gamification badges (beyond streak count).

11. Market Context & Positioning

11.1 Market Snapshot

- The global health & wellness app market is valued in the tens of billions of dollars and continues to grow each year, driven by increased interest in self-tracking and preventative health.

- Most consumer apps focus on steps, calories, generic HRV, or meditation; very few focus specifically on metabolic temperature + pulse for thyroid-style assessment.
- Many “biohacking” apps emphasize gadgets and subscriptions, creating high ongoing costs and complexity for users.

11.2 Competitive Gaps 98.6° Fills

1. Metabolism-first, not generic wellness
    - Competing apps rarely track oral/axillary temperature plus pulse in a Peat/Barnes-influenced way; they treat temp as a fever check, not a metabolic signal.
2. Evidence-heavy, but human-readable
    - Most apps either provide vague advice or bury users in raw PubMed links. 98.6° uses 120+ studies but explains them in plain English and ties them directly to specific compounds and patterns.
3. One-time price instead of subscriptions
    - The majority of wellness apps rely on monthly subscriptions or aggressive upsells. 98.6° offers a single, transparent payment and lifetime access.
4. Aesthetic and emotional differentiation
    - Competing products lean clinical or techy. 98.6° uses a watercolor, coastal aesthetic that feels calm, personal, and book-ish rather than medical.

11.3 Positioning Statement (for landing page)

For people who actually track their temperature and pulse, 98.6° is the only app that combines Peat-style logging, a research-backed compound library, and doctor-ready reports in a single, one-time purchase.

---

12. Target Customer

The #1 Pain Point 98.6° Addresses:

"I feel terrible, my doctor says I'm fine, and I have no way to prove what's happening in my body over time."

This pain point appeared in nearly every major Reddit thread across r/Hypothyroidism, r/Hashimotos, r/PMDD, and r/Biohackers. It combines:

- The emotional frustration of medical dismissal
- The practical gap of having no organized, multi-point daily data
- The desire for a doctor-ready artifact that validates the patient's lived experience

98.6° solves this by turning scattered, forgotten readings into clear metabolic trends and one-tap exportable reports—giving Sarah something concrete to bring to her next appointment, and giving her the confidence that she is not imagining her symptoms.

Primary Avatar: "Sarah"

Demographics: Female, 28–42, US-based, household income $45K–$100K, comfortable with mobile apps and self-directed health research.

Psychographics: Health-conscious but frustrated. She has dealt with fatigue, cold hands and feet, brain fog, or menstrual irregularity for months or years. She has had bloodwork done and been told her labs are "normal," but she knows something is not right. She may have discovered pro-metabolic health ideas through social media, podcasts, or Reddit, and she may or may not follow a named methodology. She cares more about feeling better than about labels.

Current tracking behavior: Logs temperature and/or pulse in the Notes app, a paper notebook, or a spreadsheet—but inconsistently. Data is scattered, hard to review, and useless at a doctor visit.

Core pain points (ranked):

1. Feels terrible despite "normal" lab results; wants data to prove something real is happening.
2. Tracks in a messy, unsustainable way and keeps losing data.
3. Cannot connect symptoms to metabolic patterns without consistent multi-point daily tracking.
4. Has no clean, doctor-ready report to bring to appointments.
5. Is tired of subscriptions, locked data, and expensive hardware.

Previous solutions tried: Generic health apps, symptom trackers, Lumen, CGM apps, Dr. Rind's paper temperature graph, Notes app, spreadsheets.

Discovery channels: Instagram and TikTok (pro-metabolic / thyroid / women's hormone creators), Reddit (r/Hypothyroidism, r/Hashimotos, r/raypeat, r/Biohackers, r/PMDD), pro-metabolic podcasts, Google search for "basal temperature tracking" and "metabolism app."

Purchase triggers: Purpose-built for temp + pulse (not generic), one-time price with no subscription, doctor-ready report feature, research library backed by real studies, calm non-clinical design.

Secondary Avatar: "Marcus"

Demographics: Male, 30–50, self-taught biohacker or health optimizer.

Profile: Already tracks extensively using spreadsheets or devices. Follows pro-metabolic or bioenergetic methodology. Wants a cleaner, faster, purpose-built tool for temp/pulse tracking with better charts and exportable data.

Secondary Avatar: "Elena"

Demographics: Female, 35–55, experiencing perimenopause or early menopause.

Profile: Symptoms (fatigue, temperature swings, mood changes, worsening PMS) have intensified and she suspects a thyroid connection. New to metabolic tracking but highly motivated. Values menstrual cycle tagging and the ability to see how vitals shift across her cycle.

Addressable Community Size

- ~10% of the US population has hypothyroidism (~25M+ people), with 76%+ being female.
- Fewer than 50% of reproductive-aged women with hypothyroidism receive treatment.
- An estimated 13 million Americans have undiagnosed hypothyroidism.
- Only 12% of Americans are considered metabolically healthy.

Positioning Hook (Internal)

98.6° is for the woman who Googles "why am I always cold" at 11 PM, who has a screenshot of her last TSH result saved on her phone, and who has tried three different ways to track her temperature this year. She does not need another wellness app. She needs a tool that finally makes her data useful.

12.1 Brand Voice & Tone (for all marketing/landing copy)

Use this as the style guide for any landing page copy Computer writes.

- Voice:
  - Informed, calm, slightly wry.
  - Sounds like someone who actually read the studies and Peat books, not a marketer.
  - Willing to say “We don’t know yet” when evidence is mixed.
- Tone guidelines:
  - Avoid hype (“miracle”, “fix”, “biohack”).
  - Prefer phrases like “research suggests”, “these patterns often show up when…”.
  - Never give prescriptive medical instructions; always frame as informational.
  - Speak directly to the reader: “you”, “your readings”, “your metabolism”.
- Examples of on-brand lines:
  - “You don’t need another generic wellness app. You need a better way to read your own data.”
  - “Built for people who actually take their temperature.”
  - “Less guesswork. More patterns you can actually see.”

---

13. Visual Identity & Color Swatches

Use these exact hex codes on the landing page, app, and marketing.

13.1 Core Palette

- Seafoam / Teal (Primary accent)
  - Hex: `#4CB7A5`
  - Use for: FAB button, primary CTAs, active states, “Ask 98.6” pill, key highlights.
- Coral (Alert / Secondary accent)
  - Hex: `#E88868`
  - Use for: warnings, “Important Cautions” label accents, occasional emphasis tags.
- Navy (Primary text / Headings)
  - Hex: `#1F3654`
  - Use for: main headings, important labels, chart lines.
- Warm Sand / Card Background
  - Hex: `#F7F1E8`
  - Use for: card backgrounds, page background tint behind the device mockups.

- Soft Sage / Secondary Background
  - Hex: `#D7E3DC`
  - Use for: subtle sections, chart bands, very soft dividers.
- Muted Brown-Grey (Watercolor Shadows / Icons)
  - Hex: `#8A7565`
  - Use as overlay for watercolor textures and some compound icons.
- Error / Danger
  - Hex: `#D9534F`
  - Use sparingly for destructive actions (Delete entry) or critical warnings.

13.2 Neutrals

- Off-White: `#FFFDF8` (page background on landing site).
- Light Grey: `#E3E0DA` (borders, subtle dividers).
- Body Text Grey: `#4A4A4A` (secondary copy).

13.3 Typography

- Display / Headings:
  - Style: serif, elegant (e.g., “Research Library” title).
  - Landing page instruction: use a modern serif like “Playfair Display” or “Cormorant Garamond” for H1/H2.
- Body / UI Text:
  - Style: clean sans-serif (e.g., “Inter”, “SF Pro”, “Work Sans”).
  - Slightly larger than default mobile body copy for readability.
